### (57) ABSTRACT

A fluid spray apparatus includes an inlet and first and second outlets. A first actuator may communicate the inlet with at least one of the outlets. A second actuator also may communicate the inlet with at least one of the outlets. A passage network of the fluid spray apparatus communicates the first and second actuators with the first and second outlets. A diverter structure is disposed in the passage network. The diverter structure includes a first diverter structure arrangement. In the first diverter structure arrangement, the first actuator communicates the inlet with the first outlet and the second actuator communicates the inlet with the second outlet. The diverter structure also includes a second diverter structure arrangement. In the second diverter structure arrangement, the first actuator communicates the inlet with the second outlet and the second actuator communicates the inlet with the first outlet.

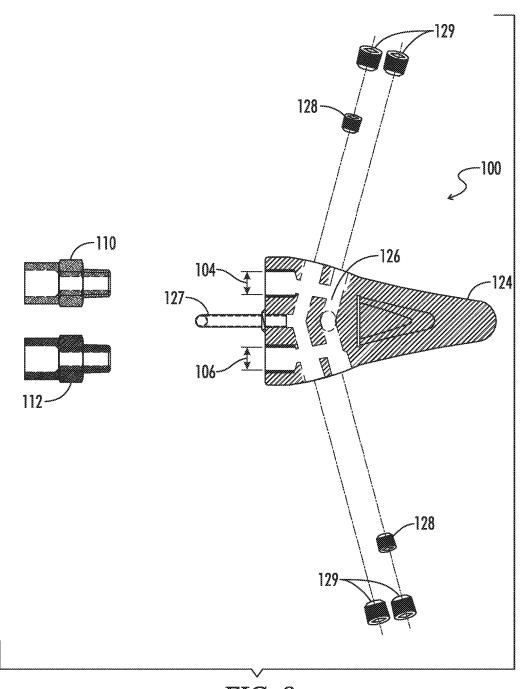

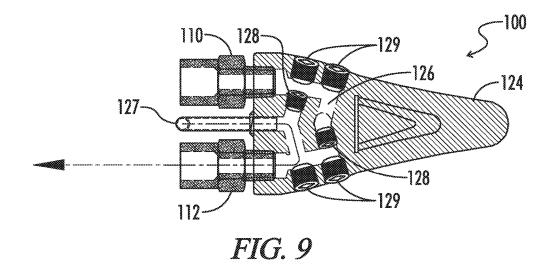

FIG. 8

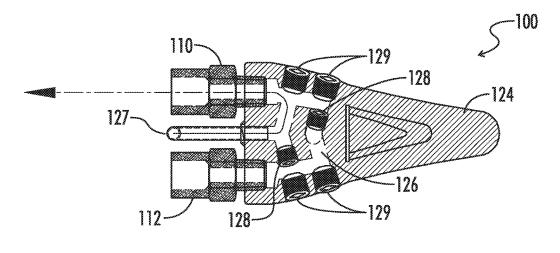

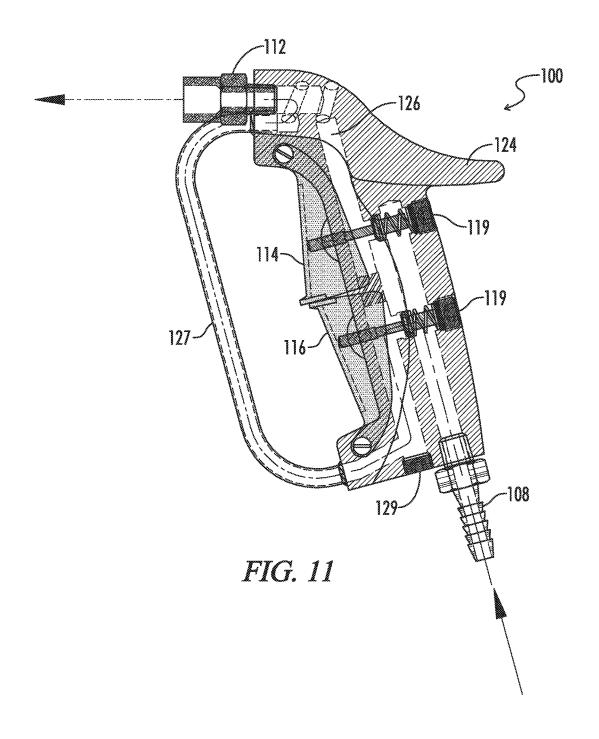

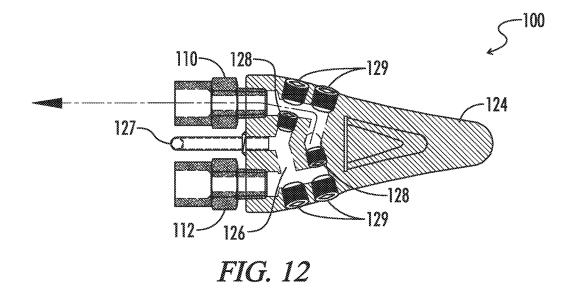

FIG. 10

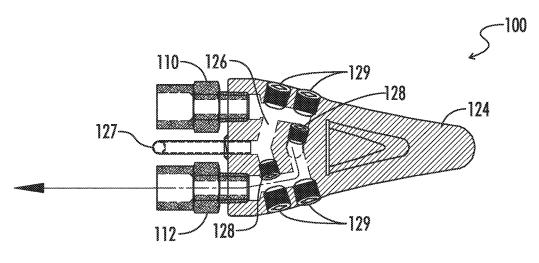

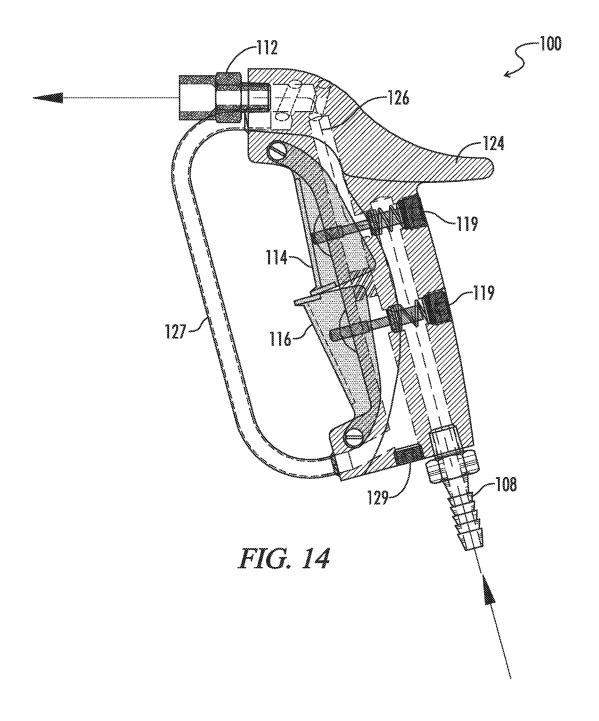

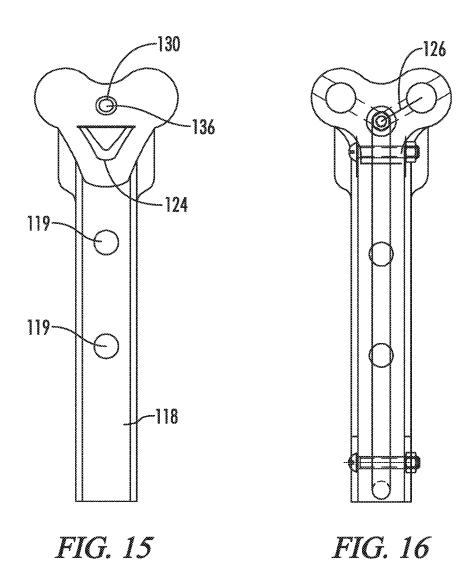

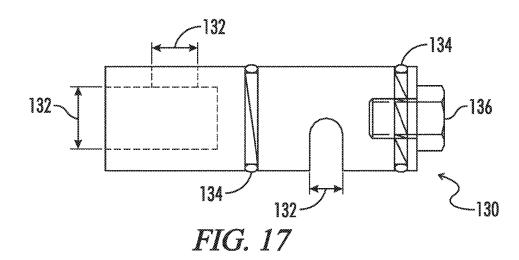

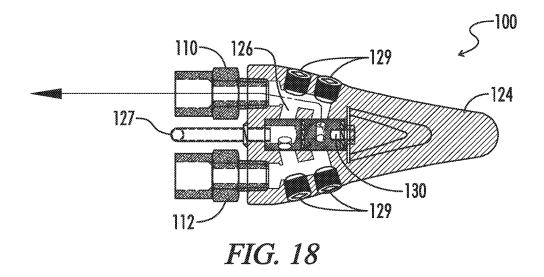

FIG. 13

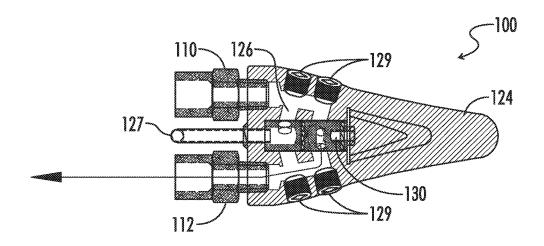

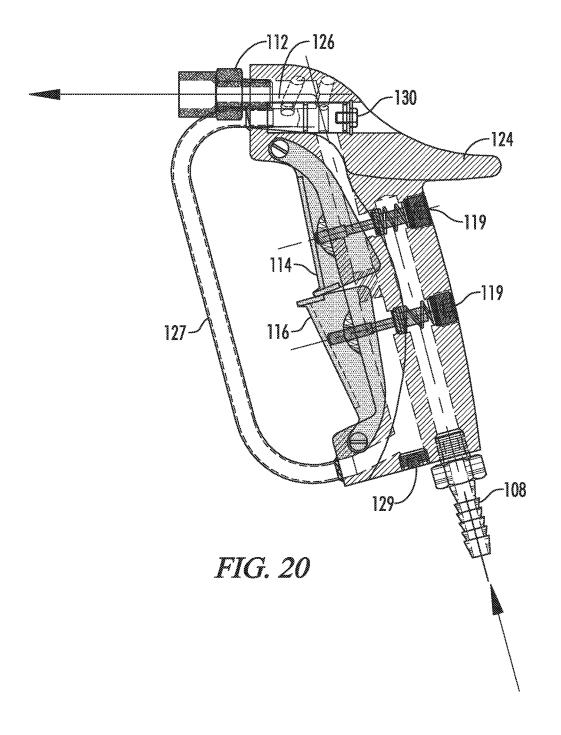

FIG. 19

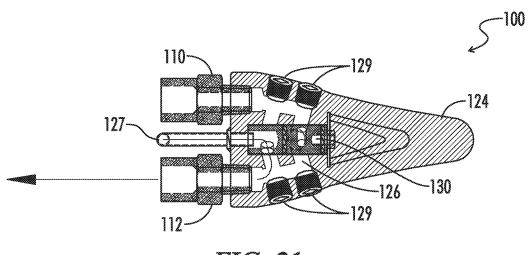

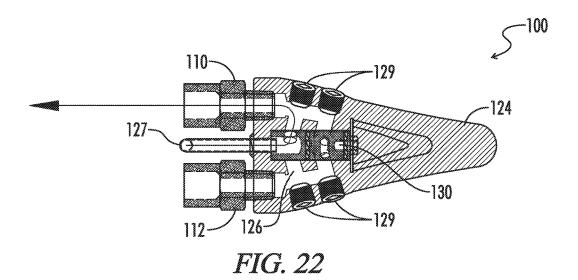

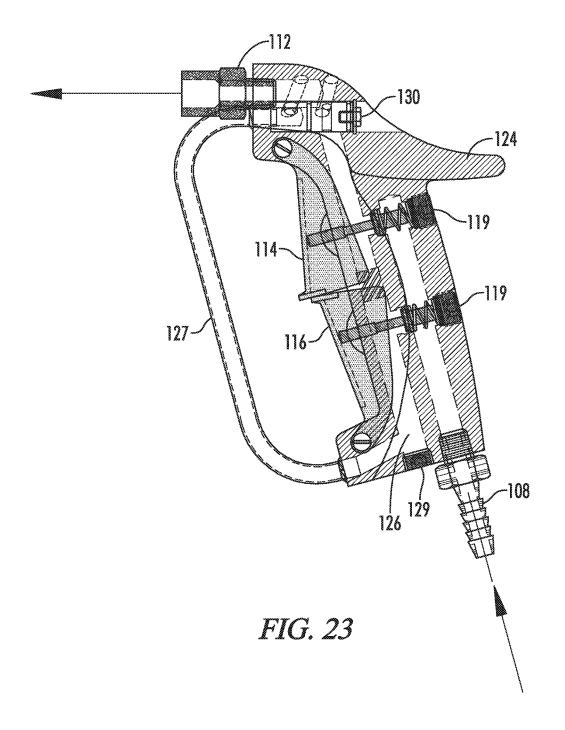

FIG. 21

## **DUAL NOZZLE SPRAY GUN**

#### BACKGROUND

The present disclosure relates generally to a fluid spray apparatus. More particularly, the present disclosure pertains to a fluid spray gun including multiple outlets.

Fluid spray guns are known in the art. In herbicide applications, spray guns with adjustable nozzles designed to be twisted back and forth by a user are available. A user may wish to apply herbicide to a nearby target with a fan-type pattern and to a distant target with a straight stream pattern that will break up into smaller droplets near the target. To adjust the nozzle to either setting, the user must remove his or her hand from the backpack pumping lever to twist the adjustable nozzle. This method also requires the user to make contact with parts covered in the herbicide. Furthermore, the method can become tiresome to a user, prompting the user to leave the nozzle on the straight stream pattern. If left on the straight stream pattern, the spray will overpenetrate the nearby targets and cause poor performance, environmental problems, and wasted herbicide.

#### **BRIEF SUMMARY**

Some embodiments of the current disclosure may allow for spraying different patterns using only one hand, transitioning from one pattern to another quickly and easily, and optionally reversing the actuator-output relationship.

Briefly, the present disclosure relates, in one embodiment, to a fluid spray apparatus. The fluid spray apparatus includes an inlet and first and second outlets. The fluid spray apparatus further includes a first actuator. The first actuator is configured to communicate the inlet with at least one of the 35 outlets. The fluid spray apparatus also includes a second actuator. The second actuator is also configured to communicate the inlet with at least one of the outlets. A passage network of the fluid spray apparatus communicates the first and second actuators with the first and second outlets. A 40 diverter structure is disposed in the passage network. The diverter structure includes a first diverter structure arrangement. In the first diverter structure arrangement, the first actuator communicates the inlet with the first outlet and the second actuator communicates the inlet with the second 45 outlet. The diverter structure also includes a second diverter structure arrangement. In the second diverter structure arrangement, the first actuator communicates the inlet with the second outlet and the second actuator communicates the inlet with the first outlet.

In an alternative embodiment, the diverter structure includes a plurality of plugs removably disposed in one of a plurality of positions blocking a portion of the passage network.

In still another embodiment, the diverter structure 55 includes a selector valve.

In yet another embodiment, the first diverter structure arrangement and the second diverter structure arrangement are mutually exclusive.

In another embodiment, the first outlet and the second 60 outlet are each configured to receive a variety of fluid spray

In a further embodiment, the first outlet includes a diffuse spray nozzle and the second outlet includes a solid stream nozzle.

In a further still embodiment, at least one of the first outlet and the second outlet includes an adjustable spray nozzle. 2

Yet another embodiment includes a handle, and the first and second actuators are hingedly and opposingly disposed on the handle.

In still another embodiment, each of the first and second actuators includes a hinge end and a free end opposite the hinge end. The actuators are positioned such that the free ends are nearer each other than the hinge ends.

In an even further embodiment, the handle includes a pistol grip handle.

The present disclosure also relates, in one embodiment, to a fluid spray apparatus including an inlet, a first outlet, and a second outlet. A first actuator is configured to communicate the inlet with at least one of the outlets. A second actuator is configured to communicate the inlet with at least one of the outlets. The fluid spray apparatus also includes a selector valve. The selector valve includes a first position wherein the first actuator communicates the inlet with the first outlet and the second actuator communicates the inlet with the second position wherein the first actuator communicates the inlet with the second outlet and the second actuator communicates the inlet with the second outlet and the second actuator communicates the inlet with the first outlet.

In another embodiment, the first outlet and the second outlet are each configured to receive one of a variety of fluid spray nozzles.

In one embodiment, the first actuator includes a first trigger and the second actuator includes a second trigger.

In a further embodiment, the first and second triggers are configured to be aligned with each other and opposed to each other.

In a further still embodiment, the handle includes a pistol grip handle.

In an even further embodiment, each of the first and second actuators is further configured to prevent communication between the inlet and at least one of the outlets when the actuators are unactuated.

In another embodiment, the selector valve is configured to be rotated to the first position and to the second position by a user.

The present disclosure also relates, in an embodiment, to a method of operating a fluid spray apparatus having a fluid inlet and first and second fluid outlets. The method includes placing a diverter structure in a first arrangement. With the diverter structure in the first arrangement, a first trigger is actuated to flow fluid from the inlet to the first outlet. Also with the diverter structure in the first arrangement, a second trigger is actuated to flow fluid from the inlet to the second outlet. The method further includes placing the diverter structure in the second arrangement. With the diverter structure in the second arrangement, the first trigger is actuated to flow fluid from the inlet to the second outlet. Also with the diverter structure in the second arrangement, the second trigger is actuated to flow fluid from the inlet to the first outlet.

In a further embodiment, placing the diverter structure in the first arrangement includes removably placing a plurality of plugs in the first arrangement to block a portion of a passage network of the fluid spray apparatus. Placing the diverter structure in the second arrangement includes removably placing the plurality of plugs in the second arrangement to block a different portion of the passage network.

In another embodiment, placing the diverter structure in the first arrangement includes placing a selector valve in a first position. Placing the diverter structure in the second arrangement includes placing the selector valve in a second position.

## BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a side view of one embodiment of the fluid spray apparatus.

FIG. 2 is a top view of the fluid spray apparatus of FIG. 5

FIG. 3 is a rear view of the fluid spray apparatus of FIG. 1.

FIG. 4 is a front view of the fluid spray apparatus of FIG. 1 with the actuators removed.

FIG. 5 is a side cross-sectional partially exploded view of the fluid spray apparatus of FIG. 1.

FIG. 6 is a side view of the fluid spray apparatus of FIG. 1 with the actuators removed.

FIG. 7 is a front cross-sectional view of the fluid spray 15 apparatus of FIG. 1.

FIG. 8 is a top cross-sectional partially exploded view of the fluid spray apparatus of FIG. 1.

FIG. 9 is a top cross-sectional view of the fluid spray apparatus of FIG. 1 with the diverter structure in a first 20 arrangement and the bottom actuator actuated.

FIG. 10 is a top cross-sectional view of the fluid spray apparatus of FIG. 1 with the diverter structure in a second arrangement and the bottom actuator actuated.

FIG. 11 is a side cross-sectional view of the fluid spray 25 apparatus of FIG. 1 with the bottom actuator actuated.

FIG. 12 is a top cross-sectional view of the fluid spray apparatus of FIG. 1 with the diverter structure in a first arrangement and the top actuator actuated.

FIG. 13 is a top cross-sectional view of the fluid spray 30 apparatus of FIG. 1 with the diverter structure in a second arrangement and the top actuator actuated.

FIG. 14 is a side cross-sectional view of the fluid spray apparatus of FIG. 1 with the top actuator actuated.

FIG. 15 is a rear view of one embodiment of the fluid 35 spray apparatus.

FIG. 16 is a front cross-sectional view of the fluid spray apparatus of FIG. 15.

FIG. 17 is a side view of a selector valve of the fluid spray apparatus of FIG. 15.

FIG. 18 is a top cross-sectional view of the fluid spray apparatus of FIG. 15 with the diverter structure in a first arrangement and the top actuator actuated.

FIG. 19 is a top cross-sectional view of the fluid spray apparatus of FIG. 15 with the diverter structure in a second 45 arrangement and the top actuator actuated.

FIG. 20 is a side cross-sectional view of the fluid spray apparatus of FIG. 15 with the top actuator actuated.

FIG. 21 is a top cross-sectional view of the fluid spray apparatus of FIG. 15 with the diverter structure in a first 50 arrangement and the bottom actuator actuated.

FIG. 22 is a top cross-sectional view of the fluid spray apparatus of FIG. 15 with the diverter structure in a second arrangement and the bottom actuator actuated.

apparatus of FIG. 15 with the bottom actuator actuated.

#### DETAILED DESCRIPTION

Reference will now be made in detail to embodiments of 60 the present disclosure, one or more drawings of which are set forth herein. Each drawing is provided by way of explanation of the present disclosure and is not a limitation. In fact, it will be apparent to those skilled in the art that various modifications and variations can be made to the 65 teachings of the present disclosure without departing from the scope of the disclosure. For instance, features illustrated

or described as part of one embodiment can be used with another embodiment to yield a still further embodiment.

Thus, it is intended that the present disclosure covers such modifications and variations as come within the scope of the appended claims and their equivalents. Other objects, features, and aspects of the present disclosure are disclosed in, or are obvious from, the following detailed description. It is to be understood by one of ordinary skill in the art that the present discussion is a description of exemplary embodiments only and is not intended as limiting the broader aspects of the present disclosure.

The words "connected" and "attached" should be interpreted to mean any manner of joining two objects including, but not limited to, the use of any fasteners such as screws, nuts and bolts, bolts, pin and clevis, and the like allowing for a stationary, translatable, or pivotable relationship; welding of any kind such as traditional MIG welding, TIG welding, friction welding, brazing, soldering, ultrasonic welding, torch welding, inductive welding, and the like; using any resin, glue, epoxy, and the like; being integrally formed as a single part together; any mechanical fit such as a friction fit, interference fit, slidable fit, rotatable fit, pivotable fit, and the like; any combination thereof; and the like.

Unless specifically stated otherwise, any part of the apparatus of the present disclosure may be made of any appropriate or suitable material including, but not limited to, metal, alloy, polymer, polymer mixture, wood, composite, or any combination thereof.

Referring to the Figures, one embodiment of a fluid spray apparatus, or spray gun, 100 is shown. As can best be seen in FIG. 5, the spray gun 100 includes an inlet 102, a first outlet 104, and a second outlet 106. The spray gun 100 optionally includes a hose attachment barb 108 on the inlet 102. The inlet 102 could alternatively include a quickrelease connector, a threaded male or female coupler, and the like. The spray gun 100 may also include a first nozzle 110 disposed on the first outlet 104 and a second nozzle 112 disposed on the second outlet 106. Both first nozzle 110 and second nozzle 112 may be permanently connected or removably connected to the spray gun 100. The first and second nozzles 110, 112 may include commonly available standard spray tips that are threadedly received in the first and second outlets 104, 106 respectively. In other embodiments, the nozzles 110, 112 are retained in the outlets 104, 106 with quick-release, snap-on, latching, or other releasable attachment configurations. First nozzle 110 and second nozzle 112 may be of varying spray patterns such that the spray gun 100 may operate with any of a plurality of spray patterns. One embodiment of the spray gun 100 includes the first outlet 104 including a diffuse spray nozzle and the second outlet 106 including a solid stream nozzle. Another embodiment of the spray gun 100 includes at least one of the first outlet 104 and second outlet 106 including an adjustable spray nozzle.

In an embodiment, a first actuator 114 is configured to FIG. 23 is a side cross-sectional view of the fluid spray 55 communicate the inlet 102 with at least one of the outlets 104, 106 such that communication is prevented when the first actuator is unactuated. A second actuator 116 is also configured to communicate the inlet 102 with at least one of the outlets 104, 106 such that communication is prevented when the second actuator is unactuated. Each actuator 114, 116 may actuate valves 115 that are normally biased toward the closed position by springs 117. Each valve 115 may be accessible for replacement or repair by removing a spring retainer plug 119 with common tools, including, but not limited to, a hex key. The actuators 114, 116 may be hingedly connected to the handle 118 such that the actuators include triggers. In some embodiments, the handle 118 may

be a pistol grip handle. The actuators 114, 116 may be aligned with each other and opposingly disposed on the handle 118. The actuators 114, 116 may be configured such that the first actuator 114 may be actuated with the index finger and middle finger of a user and the second actuator 5 116 may be actuated with the ring finger and little finger of the user. Each actuator 114, 116 may include a hinge end 120 and a free end 122. The free ends 122 of the actuators 114, 116 may be nearer each other than the hinge ends 120.

The handle 118 of the spray apparatus may, in some 10 embodiments, include guide channels 123 configured to receive a portion of a respective trigger/actuator 114, 116. The guide channels 123, in conjunction with the curved free ends 122 of the triggers 114, 116, may prevent pinching a user's fingers when one or more of the triggers are actuated. 15 In at least one embodiment, the trigger free ends 122 remain in contact with each other during actuation. The channels 123 also may function to prevent over-actuation of the actuators 114, 116. The channels 123 may further function to hold the actuators in close readiness to the valve assembly. 20

In some embodiments, the handle 118 is angled from the spray direction of the nozzles 110, 112 such that the handle and the spray direction of the nozzles forms an angle of between 90 and 180 degrees. More specifically, the handle 118 and the spray direction of the nozzles 110, 112 form an 25 angle of between 90 and 120 degrees. Even more specifically, the handle 118 and the spray direction of the nozzles 110, 112 form an angle of 105 degrees. These angles may be desirable to allow for ergonomic and comfortable use for a user's wrist when holding the spray apparatus 100. Further- 30 more, the spray apparatus 100 may include a flat or contoured protrusion 124 extending from the handle. The protrusion 124 may be configured such that a user's hand between the thumb and index finger may rest against the protrusion to aid in supporting the weight of the spray 35 apparatus 100. Another ergonomic feature optionally included in the spray apparatus 100 is the location of the inlet 102 at the bottom of the handle 118. This location allows for any hose attached to the hose attachment barb 108 to extend below the wrist of a user so the hose does not get 40 in the way of the user's arm and so the weight of the hose and the spray gun 100 may be close to the user's hand.

Some embodiments of the fluid spray apparatus 100 may include a passage network 126 including multiple paths connecting the inlet 102 with the first outlet 104 and second 45 outlet 106. The paths may be, but are not limited to, one or more paths defined in the handle 118 of the spray apparatus 100, one or more tubes 127 exterior to the handle of the spray apparatus, and the like.

In one embodiment of the fluid spray apparatus **100**, a 50 diverter structure including a plurality of plugs **128** may be removably disposed in one of a plurality of positions blocking a portion of the passage network **126**. Threaded covers **129** may be removed with common tools including, but not limited to, a hex key to access the plugs **128** or to clean the 55 passage network **126**. The plurality of positions may form a first diverter structure arrangement and a second diverter structure arrangement. In some embodiments, the first diverter structure arrangement and the second diverter structure arrangement may be mutually exclusive.

As shown in FIGS. 9 and 12, the plurality of plugs 128 may be placed in a first diverter structure arrangement wherein the first actuator 114 may communicate the inlet 102 with the first outlet 104 and the second actuator 116 may communicate the inlet with the second outlet 106. In 65 embodiments including the hose attachment barb 108 and the first and second nozzles 110, 112, the first actuator 114

may communicate the opening of the hose attachment barb with the opening of the first nozzle and the second actuator 116 may communicate the opening of the hose attachment barb with the opening of the second nozzle.

6

As shown in FIGS. 10 and 13, the plurality of plugs 128 may be placed in a second diverter structure arrangement wherein the first actuator 114 may communicate the inlet 102 with the second outlet 106 and the second actuator 116 may communicate the inlet with the first outlet 104. In some embodiments, the first actuator 114 may communicate the opening of the hose attachment barb 108 with the opening of the second actuator 116 may communicate the opening of the hose attachment barb with the opening of the first nozzle 110.

In some embodiments of the fluid spray apparatus 100, the diverter structure may include a selector valve 130. As can best be seen in FIG. 17, the selector valve 130 may include a plurality of pathways 132 to direct fluid flow. The selector valve 130 may also include one or more sealing portions, or O-rings, 134 to aid in directing fluid flow. In some embodiments, the selector valve 130 may also include a user control portion 136. The user control portion 136 may include, but is not limited to, a hex head, a lever, a button, and the like. In some embodiments of the fluid spray apparatus 100, the selector valve 130 may be configured to be rotated to a first position, or first diverter structure arrangement, and to a second position, or second diverter structure arrangement, by a user.

As shown in FIGS. 18 and 21, the selector valve 130 may be placed in a first position, or first diverter structure arrangement, wherein the first actuator 114 may communicate the inlet 102 with the first outlet 104 and the second actuator 116 may communicate the inlet with the second outlet 106. In some embodiments, the selector valve 130 may be placed in the first position and the first actuator 114 may communicate the opening of the hose attachment barb 108 with the opening of the first nozzle 110 and the second actuator 116 may communicate the opening of the second nozzle 112.

As shown in FIGS. 19 and 22, the selector valve 130 may be placed in a second position, or second diverter structure arrangement, wherein the first actuator 114 may communicate the inlet 102 with the second outlet 106 and the second actuator 116 may communicate the inlet with the first outlet 104. In some embodiments, the selector valve 130 may be placed in the second position and the first actuator 114 may communicate the opening of the hose attachment barb 108 with the opening of the second nozzle 112 and the second actuator 116 may communicate the opening of the hose attachment barb with the opening of the first nozzle 110.

The current disclosure also relates to a method of operating the fluid spray apparatus 100 including the fluid inlet 102 and first and second fluid outlets 104, 106. The method may include placing a diverter structure, including, but not limited to, the plurality of plugs 128 or the selector valve 130, in a first arrangement. With the diverter structure in the first arrangement, the user may actuate the first actuator, or first trigger, 114 to flow fluid from the inlet 102 to the first outlet 104. With the diverter structure in the first arrangement, the user may also actuate the second actuator, or second trigger, 116 to flow fluid from the inlet 102 to the second outlet 106. The user may place the diverter structure in a second arrangement. With the diverter structure in the second arrangement, the user may actuate the first actuator 114 to flow fluid from the inlet 102 to the second outlet 106. With the diverter structure in the second arrangement, the

user may also actuate the second actuator 116 to flow fluid from the inlet 102 to the first outlet 104.

In one embodiment, the method of operating the fluid spray apparatus 100 may include removably placing the plurality of plugs 128 in the first arrangement to block a 5 portion of the passage network 126 and placing the plurality of plugs in the second arrangement to block a different portion of the passage network.

In another embodiment, the method of operating the fluid spray apparatus 100 may include placing the selector valve 10 130 in a first position such that the diverter structure is in the first arrangement and a second position such that the diverter structure is in the second arrangement.

While the present disclosure has been described with particularity in relation to spraying herbicide, the present 15 disclosure may also apply to any fluid spray apparatus used for any purpose including, but not limited to, distributing paint, detergents, pesticides, disinfectants, and the like.

This written description uses examples to disclose the invention and also to enable any person skilled in the art to 20 practice the invention, including making and using any devices or systems. The patentable scope of the invention is defined by the claims, and may include other examples that occur to those skilled in the art. Such other examples are intended to be within the scope of the claims if they have 25 structural elements that do not differ from the literal language of the claims, or if they include equivalent structural elements with insubstantial differences from the literal language of the claims.

Although embodiments of the disclosure have been 30 described using specific terms, such description is for illustrative purposes only. The words used are words of description rather than limitation. It is to be understood that changes and variations may be made by those of ordinary skill in the art without departing from the spirit or the scope of the 35 present disclosure, which is set forth in the following claims. In addition, it should be understood that aspects of the various embodiments may be interchanged in whole or in part. While specific uses for the subject matter of the disclosure have been exemplified, other uses are contemplated. Therefore, the spirit and scope of the appended claims should not be limited to the description of the versions contained herein.

What is claimed is:

1. A fluid spray apparatus comprising: an inlet;

a first outlet;

8

- a second outlet;
- a first actuator configured to communicate the inlet with at least one of the outlets;
- a second actuator configured to communicate the inlet with at least one of the outlets;
- a passage network communicating the first and second actuators with the first and second outlets; and
- a diverter structure disposed in the passage network and including:
  - a first diverter structure arrangement wherein the first actuator communicates the inlet with the first outlet and the second actuator communicates the inlet with the second outlet; and
  - a second diverter structure arrangement wherein the first actuator communicates the inlet with the second outlet and the second actuator communicates the inlet with the first outlet.
- 2. The fluid spray apparatus of claim 1, wherein the diverter structure includes a plurality of plugs removably disposed in one of a plurality of positions blocking a portion of the passage network.
- 3. The fluid spray apparatus of claim 1, wherein the diverter structure includes a selector valve.
- **4**. The fluid spray apparatus of claim **1**, wherein the first diverter structure arrangement and the second diverter structure arrangement are mutually exclusive.
- **5**. The fluid spray apparatus of claim **1**, wherein the first outlet and the second outlet are each configured to receive a variety of fluid spray nozzles.
- **6**. The fluid spray apparatus of claim **1**, wherein the first outlet includes a diffuse spray nozzle and the second outlet includes a solid stream nozzle.
- 7. The fluid spray apparatus of claim 1, wherein at least one of the first outlet and the second outlet includes an adjustable spray nozzle.
- **8**. The fluid spray apparatus of claim **1**, further comprising:

a handle; and

the first and second actuators hingedly and opposingly disposed on the handle.

- **9.** The fluid spray apparatus of claim **8**, wherein each of the first and second actuators includes a hinge end and a free end opposite the hinge end, the actuators positioned such that the free ends are nearer each other than the hinge ends.
- 10. The fluid spray apparatus of claim 8, wherein the handle includes a pistol grip handle.
